Design and Coding Procedure:

My experience with JavaScript is still in its elementary stage. With that experience have tried to come up with my very first extension - **LinkedInAutoConnect**.

As soon as seeing the problem description, I thought it would be just basic HTML and JS files and started with a basic tutorial on building chrome extensions which helped me understand the flow of the controls.

But the problem statement required much more; hence I went through already available extensions, which I used recurrently to understand the complexity involved in building extensions.

With the help of an open source code available, I made changes by understanding the control flow to conform to the problem statement.

Note: Thank you for the opportunity. It was the beginning of new learning.
(On a lighter note, thank you for making my LinkedIn network grow; Initially, I had only two connections in my LinkedIn Profile, but while testing, the extension requests has been sent out to many)
